

**Preñada** Readme ([prototype link](#))

## HOW TO USE

We used Figma to implement the prototype. A mock-up iPhone 11 Pro will be shown in the webpage, and users can interact with it by clicking and scrolling. Users can start from the home page and explore the clickable components, which is prompted in blue if unclickable places are clicked. Users may also jump to the main pages by clicking the flows in the sidebar.

## WIZARD-OF-OZ & HARD-CODED FEATURES

No wizard-of-oz feature was used in the prototype so far. All the data are hard-coded though, including the date, the recordable symptoms, moods, history data curves, calendar events, and library entries.

## LIMITATIONS

We didn't sketch the login page and the profile page in order to focus on the three tasks. Besides, we did not sketch all possible variants that would stem from clicking on all the buttons, but only picked one or two main branches for each functionality to demonstrate the tasks.
